

Asterisk-Repository einbinden

Im nächsten Schritt binden wir das Asterisk-Repository von <https://www.asterisk.org> ein. Mit Hilfe dieser Paketquelle erschlagen wir gleich zwei wesentliche Punkte.

1. wir können die Programmpakete direkt via **yum** installieren und müssen die Programme nicht selbst aus den Quellen übersetzen und installieren
2. Sobald neue Versionen von Asterisk veröffentlicht werden, können wir dies über den Updatemechanismus einfach installieren. (*Wie immer Onkel Peer zu sagen pflegte: „Patches, die nicht eingespielt werden, nützen nichts“¹⁾*)

Wir wechseln als erstes in das Konfigurationsverzeichnis.

```
# cd /etc/yum.repos.d/
```

Nun legen wir die Repository-Konfigurationsdatei **centos-asterisk.repo** an.

```
# vim centos-asterisk.repo
```

```
[asterisk-tested]
name=CentOS-$releasever - Asterisk - Tested
baseurl=http://packages.asterisk.org/centos/$releasever/tested/$basearch/
enabled=0
gpgcheck=0
priority=10
#gpgkey=http://packages.asterisk.org/RPM-GPG-KEY-Digium

[asterisk-current]
name=CentOS-$releasever - Asterisk - Current
baseurl=http://packages.asterisk.org/centos/$releasever/current/$basearch/
enabled=1
gpgcheck=0
priority=10
#gpgkey=http://packages.asterisk.org/RPM-GPG-KEY-Digium
```

Anschließend legen wir noch die Datei **centos-digium.repo** an.

```
# vim centos-digium.repo
```

```
[digium-tested]
name=CentOS-$releasever - Digium - Tested
baseurl=http://packages.digium.com/centos/$releasever/tested/$basearch/
enabled=0
```

```
gpgcheck=0
priority=10
#gpgkey=http://packages.digium.com/RPM-GPG-KEY-Digium

[digium-current]
name=CentOS-$releasever - Digium - Current
baseurl=http://packages.digium.com/centos/$releasever/current/$basearch/
enabled=1
gpgcheck=0
priority=10
#gpgkey=http://packages.digium.com/RPM-GPG-KEY-Digium
```

Zum Schluss (durch)suchen wir die beiden Repositories nach den gewünschten Inhalten.

```
# yum search mISDN
```

```
